Personas Creation

1. Mariana Costa — Customer

Role: End user of the product who submits and follows up on feature requests
Goal: Wants her requests to be taken seriously and be able to track their status
Frustration: Has requested the same feature three times by email and never knows if anyone read it

Scenario: Mariana notices the app doesn't let her schedule an order in advance. She opens the feature request portal, searches to see if someone already requested something similar, finds nothing, and submits a new request explaining why she needs it.

---

2. Rui Almeida — Product Owner

Role: Decides what gets built and in what order
Goal: Wants to prioritize what delivers the most value quickly, without endless meetings
Frustration: The backlog is scattered across spreadsheets, emails and chat — impossible to see the full picture

Scenario: Rui sits down to plan the week and needs to know which requests have the most votes and the best impact/effort ratio, but today he has to manually cross-reference several spreadsheets to decide.

---

3. Catarina Reis — Developer

Role: Builds the features once they're prioritized
Goal: Wants clear tasks with real acceptance criteria, so she doesn't have to guess what "done" means
Frustration: Receives vague requests, passed on second-hand from the Product Owner, causing rework

Scenario: Catarina picks up a sprint backlog item, but the acceptance criteria are so vague she has to interrupt the Product Owner to clarify before she can even start.

---

4. Duarte Fernandes — Project Manager

Role: Oversees the overall roadmap progress
Goal: Wants visibility into progress and delivery risks, without having to micromanage
Frustration: No easy way to see lead time / cycle time trends, finds out about delays too late

Scenario: Duarte is preparing a meeting with stakeholders and needs to show how many requests were completed this month vs. what was planned, but today he has to count them manually from several sources.

Tiago → Mariana (Feature Management)

- "How would you like to submit a new feature request?"
- "Before submitting, would you like to see if someone already requested something similar? Why?"
- "Once you've submitted something, what would you like to be able to edit later?"
- "How would you like to find your past requests among many others?"

Tiago → Catarina (Requirements Engineering)

- "When a customer request arrives too vague, what would help you understand what to build?"
- "What does 'acceptance criteria' mean to you — how do you know you built something correctly?"
- "Would you like to trace which original request a task came from? Why?"

Simão → Rui (Prioritization)

- "How do you decide today what to build first?"
- "Would it help if users could vote on each other's requests? Why?"
- "If you had to estimate impact and effort, what information would you need to see?"
- "Would you trust an AI suggestion for prioritization? What would make you doubt it?"

Simão → Duarte (Product Roadmap)

- "How would you like to visualize what's shipping and when?"
- "What does a 'release' mean to you — how do you group features into one?"

- "If a feature depends on another that isn't ready, how would you like the system to show that?"

Simão → Mariana + Rui (Collaboration)

- Mariana: "After submitting a request, how would you like to know someone saw or commented on it?"
- Rui: "Would you like to mention a teammate directly on a request? For what?"
- Mariana: "How often would you expect a notification, without it feeling like spam?"

João → Rui + Catarina (Product Backlog Management)

- Rui: "How do you organize what goes into the general backlog vs. what enters a sprint?"
- Catarina: "When a task is assigned to you, what do you need to see to know you can start?"
- Catarina: "How would you like your work status (To Do/In Progress/Done) to be shown?"

João → Duarte (Dashboards & Analytics)

- "What numbers do you check every week to know if the team is on track?"
- "What's the difference between 'lead time' and 'cycle time' to you, and why would you want them shown separately?"
- "If the roadmap starts slipping, how would you like to find out, and how early?"

1. **Gestão de Funcionalidades** — criar, pesquisar e editar pedidos
2. **Priorização** — votar, priorizar e estimar
3. **Gestão do Product Backlog** — backlog, sprint backlog, estados
4. **Roadmap do Produto** — timeline visual, releases, dependências
5. **Engenharia de Requisitos** — gerar histórias, rastreabilidade
6. **Colaboração** — comentários, notificações, menções
7. **Dashboards e Analytics** — métricas, relatórios
